(54) **Pyridine and quinoline derivatives, processes for their manufacture and their use as angiotensin II antagonists.**

(57) The invention concerns pharmaceutically useful compounds of the formula I, in which R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sub>Z</sub>, X and Z have the various meanings defined herein, and their non-toxic salts, and pharmaceutical compositions containing them. The novel compounds are of value in treating conditions such as hypertension and congestive heart failure. The invention further concerns processes for the manufacture of the novel compounds and the use of the compounds in medical treatment.

**EP 0 499 415 A1**

This invention concerns novel nitrogen heterocycles and, more particularly, novel nitrogen heterocycles which possess pharmacologically useful properties in antagonising at least in part one or more of the actions of the substances known as angiotensins, and in particular of that known as angiotensin II (hereinafter referred to as "AII"). The invention also concerns pharmaceutical compositions of the novel compounds for use in treating diseases or medical conditions such as hypertension, congestive heart failure and/or hyperaldosteronism in warm-blooded animals (including man), as well as in other diseases or medical conditions in which the renin-angiotensin-aldosterone system plays a significant causative role. The invention also includes processes for the manufacture of the novel compounds and their use in treating one of the afore-mentioned diseases or medical conditions and for the production of novel pharmaceuticals for use in such medical treatments.

The angiotensins are key mediators of the renin-angiotensin-aldosterone system, which is involved in the control of homeostasis and fluid/electrolyte balance in many warm-blooded animals, including man. The angiotensin known as AII is produced by the action of angiotensin converting enzyme (ACE) on angiotensin I, itself produced by the action of the enzyme renin on the blood plasma protein angiotensinogen. AII is a potent spasmogen especially in the vasculature and is known to increase vascular resistance and blood pressure. In addition, the angiotensins are known to stimulate the release of aldosterone and hence result in vascular congestion and hypertension via sodium and fluid retention mechanisms. Hitherto there have been a number of different approaches to pharmacological intervention in the renin-angiotensin-aldosterone system for therapeutic control of blood pressure and/or fluid/electrolyte balance, including, for example, inhibiting the actions of renin or ACE. However, there remains a continuing need for an alternative approach because of the side-effects and/or idiosyncratic reactions associated with any particular therapeutic approach.

In our co-pending European Patent Applications, Publication Nos. 412848 and 453210 there are disclosed certain quinoline and pyridine derivatives respectively which have AII antagonist activity. In European patent Application, Publication No. 330327 there is described ethyl 4-[(3-amino-4-pyridyl)amino]methyl]benzoate and ethyl 4-[(3-nitro-4-pyridyl)amino]methyl]benzoate. In European Patent Application, Publication No. 9465 there is described 2-[(4-pyridyl-amino)methyl]benzoic acid. In Chemical Abstracts, Vol. 86, Abstract No. 171350u there is described 4-[(4-pyridylamino)methyl]benzoic acid.

We have now discovered that the compounds of the invention (set out below) surprisingly antagonise one or more of the actions of the substances known as angiotensins (and in particular of AII) and thus minimise the physiological effects associated with their presence in warm-blooded animals (including man) and this is the basis of the invention.

- (iv) a pyrido-pyrimidine ring;

wherein each of said groups the variables R<sup>1</sup>, R<sup>2</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sub>z</sub>, X and Z have any of the meanings defined above.

A still further particular group of compounds of the invention comprises compounds of the formula I wherein R<sup>4</sup> is (1-4C)alkyl bearing a carboxy or (1-4C)alkoxycarbonyl substituent and R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sub>z</sub>, X and Z have any of the meanings defined above.

Compounds of the invention which are of particular interest include, for example, the specific embodiments set out hereinafter in the accompanying Examples. These compounds, or a non-toxic salt thereof, are provided as a further feature of the invention. Of these compounds, those described in Examples 1, 6, 7, 8 and 11, and the non-toxic salts thereof, are particularly preferred.

Although all of the formula I compounds can form salts with suitable acids, it will be appreciated that those compounds of formula I wherein Z is other than an ester group or in which R<sup>2</sup> or R<sup>4</sup> bear a carboxy group can form salts with bases as well as with acids. Particularly suitable non-toxic salts for such compounds therefore also include, for example, salts with bases affording physiologically acceptable cations, for example, alkali metal (such as sodium and potassium), alkaline earth metal (such as magnesium and calcium), aluminium and ammonium salts, as well as salts with suitable organic bases, such as with ethanolamine, methylamine, diethylamine or triethylamine, as well as salts with acids forming physiologically acceptable anions, such as salts with mineral acids, for example with hydrogen halides (such as hydrogen chloride and hydrogen bromide), sulphuric and phosphoric acid, and with strong organic acids, for example with p-toluenesulphonic and methanesulphonic acids.

The compounds of formula I may be obtained by standard procedures of organic chemistry well known in the art for the production of structurally analogous compounds. Such procedures are provided as a further feature of the invention and include, by way of example, the following procedures in which the generic radicals have any of the values given above, unless stated otherwise:

a) For those compounds in which Z is carboxy (that is in which Z is a group of the formula -CO. OR<sup>8</sup> in which R<sup>8</sup> is hydrogen), a carboxylic acid derivative of the formula II, in which Q is a protected carboxy group selected from (1-6C)alkoxycarbonyl (especially methoxy-, ethoxy-, propoxy- or t-butoxy-carbonyl), phenoxycarbonyl, benzyloxycarbonyl and carbamoyl, is converted to carboxy.

The conversion may be carried out, for example by hydrolysis, conveniently in the presence of a suitable base such as an alkali metal hydroxide, for example, lithium, sodium or potassium hydroxide. The hydrolysis is generally carried out in the presence of a suitable aqueous solvent or diluent, for example in an aqueous (1-4C)alkanol, such as aqueous methanol or ethanol. However, it may also be performed in a mixture of an aqueous and non-aqueous solvent such as water and toluene using a conventional quaternary ammonium phase transfer catalyst. The hydrolysis is generally performed at a temperature in the range, for example, 0 - 120°C, depending on the reactivity of the group Q. In general, when Q is carbamoyl, temperatures in the range, for example, 40 - 120°C are required to effect the hydrolysis.

Alternatively, when Q is benzyloxycarbonyl the conversion may also be performed by hydrogenolysis, for example using hydrogen at 1-3 bar in the presence of a suitable catalyst, such as palladium on charcoal or on calcium sulphate, in a suitable solvent or diluent such as a (1-4C)alkanol (typically ethanol or 2-propanol) and at a temperature in the range, for example, 0 - 40°C.

Further, when Q is t-butoxycarbonyl, the conversion may also be carried out by hydrolysis at a temperature in the range, for example, 0 - 100°C, in the presence of a strong acid catalyst, such as trifluoroacetic acid. The hydrolysis may either be performed in an excess of the acid or in the presence of a suitable diluent such as tetrahydrofuran, t-butyl methyl ether or 1,2-dimethoxyethane.

b) For those compounds of formula I wherein Z is tetrazolyl, a compound of the formula III in which L is a suitable protecting group, such as trityl, benzhydryl, trialkyltin (for example trimethyltin or tributyltin) or triphenyltin, affixed to a nitrogen of the tetrazolyl moiety, is deprotected.

The reaction conditions used to carry out the deprotection necessarily depend on the nature of the group L. As an illustration, when it is trityl, benzhydryl, trialkyltin or triphenyltin, the decomposition conditions include, for example, acid catalysed hydrolysis in a mineral acid (such as aqueous hydrochloric acid), conveniently in an aqueous solvent (such as aqueous dioxan or 2-propanol). Alternatively, a trityl or benzhydryl group may be removed by hydrogenolysis, for example as described in (a) above for conversion of a benzyloxycarbonyl to a carboxy.

Compounds of the formula III wherein L is trialkyltin or triphenyltin may be obtained, for example, by reaction of a nitrile of the formula IX with a trialkyltin azide, such as tributyltin azide, or triphenyltin azide respectively. The reaction is conveniently carried out in a suitable solvent or diluent, such as toluene or xylene, and at a temperature in the range, for example, 50-150°C. Nitriles of the formula IX wherein R<sub>z</sub> is hydrogen or alkyl may be obtained, for example, by alkylation of a 4-aminopyridine of the formula IV wherein R<sup>1</sup> and R<sup>3</sup> are other than hydrogen and R<sub>z</sub> is hydrogen or alkyl with a nitrile of the formula X wherein Hal. stands for a suitable leaving group such as chloro, bromo, iodo, methanesulphonyloxy or p-toluenesulphonyloxy, using similar conditions to those used in process (c) described hereinafter. The necessary compounds of formula X may be made by standard procedures such as that illustrated in Scheme 1 for compounds in which X is phenylene. Alternatively, the nitriles of the formula IX may be obtained from stepwise conversion of a compound of formula I wherein Z is a group of the formula -CO.OR<sup>8</sup> under standard conditions.

The nitriles of the formula IX wherein R<sub>z</sub> is hydrogen or alkyl may also be obtained, for example, by reaction of a pyridine of the formula VII wherein Y<sup>1</sup> is a suitable leaving group (such as chloro, bromo, iodo, methanesulphonyl, methanesulphonyloxy, p-toluenesulphonyloxy or trifluoromethanesulphonyloxy) with an amine of the formula XI wherein R<sub>z</sub> is hydrogen or alkyl, using similar conditions to those used in process (d) described hereinafter.

A nitrile of formula IX wherein R<sub>z</sub> is alkanoyl or benzoyl may subsequently be obtained from a nitrile of the formula IX wherein R<sub>z</sub> is hydrogen by acylation using standard conditions well known in the art.

The amines of the formula XI wherein R<sub>z</sub> is hydrogen or alkyl may be obtained, for example, by standard procedures such as that illustrated in Scheme 1 for compounds in which X is phenylene, or by analogy with Scheme 2.

Alternatively, compounds of the formula III wherein R<sub>z</sub> is hydrogen or alkyl may be obtained, for example, by reaction of a pyridine of the formula VII wherein Y<sup>1</sup> is as defined above with an amine of the formula XII wherein R<sub>z</sub> is hydrogen or alkyl under similar conditions to those described in process (d) hereinafter. It will be appreciated that a compound of the formula III wherein R<sub>z</sub> is alkanoyl or benzoyl may subsequently be obtained from a formula III compound wherein R<sub>z</sub> is hydrogen by acylation. The amines of formula XII wherein R<sub>z</sub> is hydrogen or alkyl may be obtained, for example, from the appropriate bromomethyl compound by standard procedures such as those shown in Schemes 1 and 2.

c) For compounds of the formula I in which R<sub>z</sub> is hydrogen or alkyl, an aminopyridine of the formula IV in which R<sub>z</sub> is hydrogen or alkyl is alkylated with a compound of the formula V wherein Hal. stands for a suitable leaving group such as chloro, bromo, iodo, methanesulphonyloxy or p-toluenesulphonyloxy.

The reaction is preferably carried out in the presence of a suitable non-nucleophilic base, for example, an alkali metal *tert*-butoxide such as sodium or potassium *tert*-butoxide, an alkali metal hydride such as sodium hydride, or an alkali metal carbonate such as sodium or potassium carbonate, or an organic base such as diisopropylethylamine or 4-dimethylaminopyridine. The reaction is conveniently carried out in a suitable solvent or diluent, for example, a (1-4C)alkanol such as methanol or ethanol, or in a polar solvent such as N,N-dimethylformamide or N-methylpyrrolidone and at a temperature in the range, for example, 10 - 100°C. In carrying out process (c), when in the starting material R<sup>8</sup> is hydrogen, about two molecular equivalents of a suitable base is generally required, whereas when R<sup>8</sup> is other than hydrogen the presence of one molecular equivalent of a suitable base is generally sufficient.

Procedure (c) is particularly suitable for the production of those compounds of the formula I in which R<sub>z</sub> is hydrogen or alkyl and Z is a group of the formula -CO.OR<sup>8</sup> in which R<sup>8</sup> is other than hydrogen, for example wherein R<sup>8</sup> is (1-6C)alkyl, benzyl or phenyl, which compounds are also starting materials of formula II for the reaction described in (a) above. Similarly, using an analogous procedure, but starting with the appropriate compound of the formula VI, the starting materials of the formula III may be obtained for procedure (b).

Many of the aminopyridines of formula IV wherein R<sub>z</sub> is hydrogen or alkyl are already known and the remainder can be made by analogy therewith using standard procedures of organic chemistry well known in the art, for example as described in standard works of heterocyclic chemistry such as that edited by Elderfield. The necessary compounds of the formula V (and also of formula VI) may be made by standard procedures such as those which are illustrated in Scheme 1 for compounds in which X is phenylene.

Compounds of the formula VI wherein X is phenylene and R<sup>5</sup> and R<sup>6</sup> are both hydrogen may also be conveniently obtained by reaction of a Grignard reagent, formed from a suitably substituted 4-bromotoluene, with

a trialkyltin halide, such as tributyltin chloride, followed by reaction of the resulting (substituted)phenyltrialkyltin compound with a bromobenzonitrile in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium, and azo(bisisobutyronitrile). The resultant substituted 4'-methyl-biphenylcarbonitrile may then be converted to a compound of the formula VI by carrying out steps (b), (c) and (d) in a similar manner to that shown in Scheme 1. Alternatively, suitably substituted 4'-methylbiphenylcarbonitriles may be obtained by reaction of 4-methylphenylboronic acid with an appropriately substituted bromobenzonitrile in the presence of a suitable palladium catalyst, such as palladium (II)chloride or tetrakis(triphenylphosphine)palladium, and azo(bisisobutyronitrile).

(d) For compounds in which R<sub>z</sub> is hydrogen or alkyl, a heterocyclic derivative of the formula VII wherein Y<sup>1</sup> is a suitable leaving group (such as chloro, bromo, iodo, methanesulphonyl, methanesulphonyloxy, *p*-toluenesulphonyloxy or trifluoromethanesulphonyloxy) is reacted with an amine of the formula VIII wherein R<sub>z</sub> is hydrogen or alkyl.

The reaction is optionally carried out in the presence of a suitable base, for example an alkali metal carbonate or bicarbonate such as sodium or potassium carbonate or bicarbonate, or an organic base for example a tertiary amine such as triethylamine. The reaction is conveniently carried out in a suitable solvent or diluent, for example a (1-4C)alkanol such as methanol, ethanol or butanol, a non-polar solvent such as dioxane or diphenyl ether, or a polar solvent such as N,N-dimethylformamide or N-methylpyrrolidone, and usually at a temperature in the range of 40 to 180°C.

Heterocyclic derivatives of the formula VII wherein Y<sup>1</sup> is halogeno may be obtained, for example, by halogenation of the corresponding 4-pyridones, 4-quinolones and azaquinolones, themselves already known or which can be made by analogy therewith using procedures well known in the art and described in standard works of organic chemistry such as that edited by Elderfield. For example, the formula VII compounds may be obtained by reaction of the corresponding 4-pyridone, 4-quinolone or azaquinolone with phosphorus oxychloride in the absence of a solvent, or in the presence of an inert solvent or diluent such as toluene or dioxane, and at a temperature in the range 60 - 110°C. Compounds of the formula VII wherein Y<sup>1</sup> is methanesulphonyloxy, *p*-toluenesulphonyloxy or trifluoromethanesulphonyloxy and R<sup>1</sup> and R<sup>3</sup> are other than hydrogen may be obtained, for example, by acylation of the corresponding 4-pyridone, 4-quinolone or azaquinolone with the corresponding sulphonyl chloride under standard conditions. Compounds of the formula VII wherein Y<sup>1</sup> is methanesulphonyl may be obtained from alkylation of the corresponding mercaptopyridine, mercaptoquinoline or mercaptoazaquinoline, themselves known or obtained by analogy therewith, followed by oxidation under standard conditions. The amines of the formula VIII wherein R<sub>z</sub> is hydrogen or alkyl are known or can be prepared by standard procedures well known in the art, for example, as illustrated in, or by analogy with, Schemes 1 and 2.

Certain 4-pyridones are described in *Monatshefte fur Chemie*, 1969, 100, 132; *J. Chem. Soc. (B)*, 1968, 866; *Liebigs Ann. Chem.*, 1882, 1656; *Heterocycles*, 1982, 13, 239; and *J. Am. Chem. Soc.*, 1974, 96(4), 1152. Also certain 4-quinolones are described in our copending European patent application, publication no. 412848. Certain 1,5- and 1,7-naphthyridin-4-ones may be obtained by reaction of a suitably substituted 3-aminopyridine with the alkyl ester of an appropriate alkanoylacetic acid in the presence of a suitable acid catalyst (such as *p*-toluenesulphonic acid) and preferably at ambient temperature, followed by cyclisation of the resulting product by refluxing in a eutectic mixture of 26.5% v/v diphenyl and 73.5% v/v diphenyl oxide. Certain 1,8-naphthyridones are described in *J. Med. Chem.* 1971, 14, 638.

(e) For those compounds of formula I wherein R<sub>z</sub> is hydrogen or alkyl and R<sup>6</sup> is hydrogen, an aminopyridine of the formula IV wherein R<sub>z</sub> is hydrogen or alkyl is reductively alkylated with an aldehyde of the formula XVI.

The reaction may be conveniently carried out in the presence of a suitable reducing agent, such as sodium cyanoborohydride, in a suitable solvent, such as toluene or methanol, and at a temperature in the range, for example, 0 to 50°C and preferably at or about ambient temperature. Preferably the reaction is carried out in two stages by first dehydrating a mixture of the formula IV and formula XVI compounds, for example by refluxing in a suitable inert solvent (such as toluene) in the presence of a suitable base (such as piperidine). The imine so formed is then reduced, for example with sodium cyanoborohydride in methanol at a temperature in the range 0 to 50°C, and preferably at or about ambient temperature.

The procedure is particularly suitable for the production of those compounds of the formula I in which R<sup>6</sup> is hydrogen and Z is a group of the formula -CO.OR<sup>8</sup> in which R<sup>8</sup> is other than hydrogen, for example wherein R<sup>8</sup> is (1-6C)alkyl, benzyl or phenyl, which compounds are also starting materials of formula II for the reaction described in (a) above. Similarly, using an analogous procedure, but starting with the appropriate compound of the formula XVII, starting materials of the formula III wherein R<sup>6</sup> is hydrogen may be obtained for procedure (b). Compounds of the formula XVI and XVII may be obtained, for example, as illustrated in Schemes 1 and 2 respectively for compounds in which X is phenylene.

Whereafter, those compounds of formula I wherein R<sub>z</sub> is alkanoyl or benzoyl may be obtained by acylation

or benzoylation of the corresponding compound of the formula I wherein Rz is hydrogen under standard conditions.

Whereafter, those compounds of formula I wherein Z is 1H-tetrazol-5-yl may be obtained by stepwise conversion of a compound of the formula I wherein Z is a group of the formula -CO.OR<sup>8</sup> into the corresponding nitrile under standard conditions, followed by reaction of the nitrile with an azide such as an alkali metal azide, preferably in the presence of an ammonium halide, and preferably in the presence of a suitable polar solvent such as N,N-dimethylformamide and at a temperature in the range, for example, 50 to 160°C.

Whereafter, those compounds of the formula I wherein Z is -CO.NH.(1H-tetrazol-5-yl), a group of the formula -CO.NH.SO<sub>2</sub>R<sup>9</sup> or a group of the formula -CO.OR<sup>8</sup> in which R<sup>8</sup> is other than hydrogen, may be obtained, for example, by reacting a carboxylic acid of the formula I in which Z is carboxy (or a reactive derivative of said acid) with 5-aminotetrazole, a sulphonamide of the formula NH<sub>2</sub>.SO<sub>2</sub>R<sup>9</sup> or a salt thereof (for example, an alkali metal salt), or a hydroxy compound of the formula HO.R<sup>8</sup> or with a salt thereof (for example, an alkali metal thereof). Suitable reactive derivatives include, for example the chloride, bromide, azide, anhydride and mixed anhydride with formic or acetic acid of the carboxylic acid of formula I as defined above. When the free acid form is used, the reaction is generally carried out in the presence of a suitable dehydrating agent such as dicyclohexylcarbodiimide or 3-(3-dimethylaminopropyl)-1-ethylcarbodiimide in the presence of a base such as triethylamine or pyridine. When a reactive derivative is used, either the reaction is carried out in the presence of a base such as mentioned above, or, for the preparation of a compound of the formula I wherein Z is a group of the formula -CO.NH.SO<sub>2</sub>R<sup>9</sup> or a group of the formula -CO.OR<sup>8</sup>, the sulphonamide or hydroxy compound is used in the form of a salt, such as its alkali metal salt (in particular the lithium, sodium or potassium salt thereof). The reaction is generally performed in the presence of a suitable diluent or solvent such as dioxan, t-butyl methyl ether or tetrahydrofuran and at a temperature in the range, for example, 0 - 60°C.

Whereafter, when an N-oxide derivative of a compound of the formula I is required, a compound of the formula I is oxidised. Suitable oxidising agents include those well known in the art for the conversion of nitrogen heterocycles to their corresponding N-oxide derivatives, for example, hydrogen peroxide or an organic peracid such as m-chloroperbenzoic acid or peracetic acid. The oxidation is preferably carried out in a suitable conventional solvent or diluent for such oxidations, for example dichloromethane, chloroform or acetic acid, and at a temperature in the general range, for example 0 to 80°C.

Whereafter, when a non-toxic salt of a compound of formula I is required, it may be obtained, for example, by reaction with the appropriate base affording a physiologically acceptable cation, or with the appropriate acid affording a physiologically acceptable anion, or by any other conventional salt formation procedure.

Further, when an optically active form of a compound of formula I is required, one of the aforesaid processes may be carried out using an optically active starting material. Alternatively, the racemic form of a compound of formula I in which Z is an acidic group may be resolved, for example by reaction with an optically active form of a suitable organic base, for example, ephedrine, N,N,N-trimethyl(1-phenylethyl)ammonium hydroxide or 1-phenylethylamine, followed by conventional separation of the diastereoisomeric mixture of salts thus obtained, for example by fractional crystallisation from a suitable solvent, for example a (1-4C)alkanol, whereafter the optically active form of said compound of formula I may be liberated by treatment with acid using a conventional procedure, for example using an aqueous mineral acid such as dilute hydrochloric acid.

According to a further aspect of the invention, there is provided a process for the manufacture of a compound of the formula I wherein Z is tetrazolyl, X is p-phenylene optionally bearing a substituent selected from (1-4C)alkyl, (1-4C)alkoxy, halogeno, trifluoromethyl, cyano and nitro, R<sup>5</sup> and R<sup>6</sup> are both hydrogen, and R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>7</sup>, and Rz have any of the meanings defined hereinbefore; which comprises reaction of a compound of the formula XIII wherein P<sup>1</sup> is an electron-deficient phenyl group or is a pyridyl or pyrimidyl group; R<sup>10</sup> is hydrogen, (1-4C)alkyl, (1-4C)alkoxy, halogeno, trifluoromethyl, cyano or nitro; and R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>7</sup> and Rz have any of the values defined above; with a base selected from an alkali metal hydroxide, (1-12C)alkanolate, (1-12C)alkanethiolate, phenolate, thiophenolate or diphenylphosphide, wherein any phenyl ring of the latter three groups may optionally bear a (1-4C)alkyl, (1-4C)alkoxy or halogeno group.

A particular value for P<sup>1</sup> when it is an electron-deficient phenyl group includes, for example, a phenyl group bearing 1, 2 or 3 electron-withdrawing groups independently selected from nitro, cyano, trifluoromethyl, di(1-4C)alkylaminosulphonyl (such as dimethylaminosulphonyl or diethylaminosulphonyl) and (1-4C)alkylsulphonyl (such as methylsulphonyl or ethylsulphonyl).

A particular value for R<sup>10</sup> when it is alkyl is, for example, methyl or ethyl; when it is alkoxy is, for example, methoxy or ethoxy; and when it is halogeno is, for example, fluoro, chloro, bromo or iodo.

A suitable value for a base is, by way of example:-  
for an alkali metal hydroxide: sodium or potassium hydroxide;  
for an alkali metal alkanolate: an alkali metal (1-8C)alkanolate, for example an alkali metal (1-4C)alkoxide, such as sodium or potassium methoxide, ethoxide, propoxide or butoxide;

for an alkali metal alkanethiolate: an alkali metal (1-8C)alkanethiolate, for example an alkali metal (1-4C)alkanethiolate such as sodium or potassium methanethiolate, ethanethiolate, propanethiolate or butanethiolate;

for a phenolate or thiophenolate: the sodium or potassium salt of phenol, thiophenol, or a phenol or thiophenol bearing a methyl, ethyl, methoxy, ethoxy, fluoro, chloro, bromo or iodo group.

A particular value for an optional substituent on a phenyl group of an alkali metal phenolate, thiophenolate or diphenylphosphide, when it is alkyl is, for example, methyl or ethyl; when it is alkoxy is, for example, methoxy or ethoxy; and when it is halogeno is, for example, fluoro, chloro or bromo.

A preferred value for P<sup>1</sup> is, for example, a nitrophenyl group or a 4-pyridyl, 4-cyanophenyl, 4-dimethylaminosulphonylphenyl, 4-methylsulphonylphenyl or 3-cyano-4-trifluoromethylphenyl group. Of these, 4-nitrophenyl is especially preferred.

A preferred value for X is, for example, when it is unsubstituted p-phenylene.

A particularly preferred base is an alkali metal alkanethiolate such as sodium or potassium propanethiolate, an alkali metal alkanolate such as sodium or potassium ethoxide, or an alkali metal thiophenolate such as sodium or potassium 4-fluorothiophenolate.

It will be appreciated that when the base is an alkali metal alkanolate, alkanethiolate, phenolate, thiophenolate or diphenylphosphide, it may be generated *in situ* from the corresponding alkanol, alkanethiol, phenol, thiophenol or diphenylphosphine with a suitable alkali metal base such as an alkali metal hydride, for example, lithium, potassium or sodium hydride. Alternatively when an alkali metal alkanolate is used, it may be convenient to employ the base as a solution in the corresponding alcohol (for example a solution of sodium methoxide in methanol).

The process of the invention is particularly useful for the preparation of compounds of the formula I wherein the tetrazolyl group is at the *ortho* position relative to the adjacent phenyl group.

The reaction is conveniently carried out in a suitable inert organic solvent or diluent, for example, a polar solvent such as N,N-dimethylformamide or N-methylpyrrolidone. Alternatively, an alkanol such as methanol or ethanol may be used, for example, when an alkali metal hydroxide or alkoxide such as sodium or potassium hydroxide, methoxide or ethoxide is employed. The reaction is generally carried out at a temperature in the range, for example, -30°C to 50°C. It will be appreciated that the choice of temperature will depend on the nature of the base employed. For example, when an alkali metal alkanethiolate or alkanolate is used, a temperature in the range of 0°C to ambient temperature is preferred.

Compounds of the formula XIII wherein R<sub>z</sub> is hydrogen or alkyl may be obtained by reaction of a boronic acid of the formula XIV wherein R<sub>z</sub> is hydrogen or alkyl with a compound of the formula XV wherein P<sup>1</sup> is an electron-deficient phenyl group having any of the meanings defined above or is a pyridyl or pyrimidyl group, and W is a bromo, iodo or trifluoromethanesulphonyloxy group, in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium, and azo(bisisobutyronitrile). The reaction is preferably carried out in the presence of a base, such as sodium or potassium carbonate, in an inert solvent or diluent, for example, a hydrocarbon such as toluene or xylene, an ether, such as dioxan or tetrahydrofuran, an (1-4C)alkanol such as methanol or ethanol, water, or mixture thereof, for example a mixture of water, methanol and toluene, and at a temperature in the range of, for example, 50°C to 150°C., and conveniently at or about the reflux temperature of the solvent or mixture of solvents used.

Compounds of the formula XIV wherein R<sub>z</sub> is hydrogen or alkyl may be obtained, for example, by heating at reflux a 4-methylphenylboronic acid in a solvent such as methyl chloroform with azeotropic removal of water, followed by radical bromination of the product which may be carried out *in situ*, for example with bromine or N-bromosuccinimide in the presence of azo(bisisobutyronitrile). The resultant 4-bromomethylphenylboronic acid anhydride may then be used to alkylate a compound of the formula IV wherein R<sub>z</sub> is hydrogen or alkyl (using similar alkylation conditions to those used in process (c) described above), followed by subsequent acidic hydrolysis, to give a formula XIV compound. Alternatively the product from the alkylation step prior to hydrolysis may be isolated and reacted directly with a compound of the formula XV under similar conditions to those described above to obtain a formula XIII compound directly. In a yet further alternative procedure, a 4-methylphenylboronic acid and an appropriate alkanediol, for example 2,2-dimethylpropan-1,3-diol, may be heated at reflux in a solvent (such as cyclohexane) with azeotropic removal of water followed by free radical bromination of the product, which may be carried out *in situ*. The resultant bromomethyl compound may then be reacted using analogous procedures to those described above for the 4-bromomethylphenylboronic acid anhydride to obtain a formula XIV compound or a compound of the formula XIII (wherein R<sub>z</sub> is hydrogen or alkyl) directly. Compounds of the formula XV may be obtained, for example, as shown in Scheme 3.

It will be appreciated that a compound of the formula XIII wherein R<sub>z</sub> is alkanoyl or benzoyl may subsequently be obtained from a formula XIII compound wherein R<sub>z</sub> is hydrogen by acylation using standard procedures.

Whereafter, the optional subsequent steps of acylation or benzylation and/or N-oxide formation and/or non-toxic salt formation and/or formation of an optically active form of a compound of the formula I, may be carried out as described above for procedures (a) to (e).

Certain of the intermediates defined herein are novel, for example the compounds of the formula II, III, IX and XIII, and are provided as a further feature of the invention.

As stated above, the compounds of formula I will have beneficial pharmacological effects in warm-blooded animals (including man) in diseases and medical conditions where amelioration of the vasoconstrictor and fluid retaining properties of the renin-angiotensin-aldosterone system is desirable, at least in part by antagonism of one or more of the physiological actions of AII. The compounds of the invention will thus be useful in the treatment of diseases or medical conditions such as hypertension, congestive heart failure and/or hyperaldosteronism in warm-blooded animals (including man), as well as in other diseases or medical conditions in which the renin-angiotensin-aldosterone system plays a significant causative role. The compounds of the invention may also be useful for the treatment of ocular hypertension, glaucoma, cognitive disorders (such as Alzheimer's disease, amnesia, senile dementia and learning disorders), as well as other diseases such as renal failure, cardiac insufficiency, post-myocardial infarction, cerebrovascular disorders, anxiety, depression and certain mental illnesses such as schizophrenia.

The antagonism of one or more of the physiological actions of AII and, in particular, the antagonism of the interaction of AII with the receptors which mediate its effects on a target tissue, may be assessed using one or more of the following, routine laboratory procedures:

#### 20 Test A:

This in vitro procedure involves the incubation of the test compound initially at a concentration of 100 micromolar (or less) in a buffered mixture containing fixed concentrations of radiolabelled AII and a cell surface membrane fraction prepared from a suitable angiotensin target tissue. In this test, the source of cell surface membranes is the guinea pig adrenal gland which is well known to respond to AII. Interaction of the radiolabelled AII with its receptors (assessed as radiolabel bound to the particulate membrane fraction following removal of unbound radiolabel by a rapid filtration procedure such as is standard in such studies) is antagonized by compounds which also bind to the membrane receptor sites and the degree of antagonism (observed in the test as displacement of membrane-bound radioactivity) is determined readily by comparing the receptor-bound radioactivity in the presence of the test compound at the specified test concentration with a control value determined in the absence of the test compound. Using this procedure compounds showing at least 50% displacement of radiolabelled AII binding at a concentration of  $10^{-4}$  M are retested at lower concentrations to determine their potency. For determination of the  $IC_{50}$  (concentration for 50% displacement of radiolabelled AII binding), concentrations of the test compound are ordinarily chosen to allow testing over at least four orders of magnitude centred about the predicted approximate  $IC_{50}$ , which latter is subsequently determined from a plot of percentage displacement against concentration of the test compound.

In general, acidic compounds of formula I as defined above show significant inhibition in **Test A** at a concentration of 50 micromolar or much less.

#### 40 Test B:

This in vitro test involves the measurement of the antagonistic effects of the test compound against AII-induced contractions of isolated rabbit aorta, maintained in a physiological salt solution at 37°C. in order to ensure that the effect of the compound is specific to antagonism of AII, the effect of the test compound on noradrenaline-induced contractions may also be determined in the same preparation.

In general, acidic compounds of formula I as defined above show significant inhibition in **Test B** at a final concentration of 50 micromolar or much less. [Note: Compounds of formula I wherein Z is a group of the formula **-CO.OR<sup>8</sup>** in which R<sup>8</sup> is other than hydrogen in general show only weak activity in the in vitro **Tests A or B.**]

#### 50 Test C:

This in vivo test involves using terminally-anaesthetised or conscious rats in which an arterial catheter has been implanted under anaesthesia for the measurement of changes in blood pressure. The AII antagonistic effects of the test compound following oral or parenteral administration, are assessed against angiotensin II-induced pressor responses. To ensure that the effect is specific, the effect of the test compound on vasopressin-induced pressor responses may also be determined in the same preparation.

The compounds of formula I generally show specific AII-antagonist properties in **Test C** at a dose of 50

mg/kg body weight or much less, without any overt toxicological or other untoward pharmacological effect.

#### Test D:

5 This in vivo test involves the stimulation of endogenous All biosynthesis in a variety of species including rat, marmoset and dog by introducing a diet of low sodium content and giving appropriate daily doses of a saluretic known as frusemide. The test compound is then administered orally or parenterally to the animal in which an arterial catheter has been implanted under anaesthesia for the measurement of changes in blood pressure.

10 In general compounds of formula I will show All-antagonist properties in **Test D** as demonstrated by a significant reduction in blood pressure at a dose of 50 mg/kg body weight or much less, without any overt toxicological or other untoward pharmacological effect.

By way of illustration of the angiotensin II inhibitory properties of compounds of formula I, the compound of example 1 gave the following results in tests A and C described above:-

In test A: an  $IC_{50}$  of  $3.48 \times 10^{-9} M$ ;

15 In test C: an  $ED_{50}$  of 0.047 mg/kg (i.v. administration).

The compounds of formula I will generally be administered for therapeutic or prophylactic purposes to warm-blooded animals (including man) requiring such treatment in the form of a pharmaceutical composition, as is well known in the pharmaceutical art. According to a further feature of the invention there is provided a pharmaceutical composition comprising a compound of formula I, or a salt or N-oxide thereof as defined above, 20 together with a pharmaceutically acceptable diluent or carrier. Such compositions will conveniently be in a form suitable for oral administration (e.g. as a tablet, capsule, solution, suspension or emulsion) or parenteral administration (e.g. as an injectable aqueous or oily solution, or injectable emulsion).

The compounds of formula I, or a non-toxic salt thereof, may also be advantageously administered for therapeutic or prophylactic purposes together with another pharmacological agent known in the general art to 25 be of value in treating one or more of the diseases or medical conditions referred to hereinabove, such as a beta-adrenergic blocker (for example atenolol), a calcium channel blocker (for example nifedipine), an angiotensin converting enzyme (ACE) inhibitor (for example lisinopril) or a diuretic (for example furosemide or hydrochlorothiazide). It is to be understood that such combination therapy constitutes a further aspect of the present invention.

30 In general a compound of formula I (or a pharmaceutically acceptable salt thereof as appropriate) will generally be administered to man so that, for example, a daily oral dose of up to 50 mg/kg body weight (and preferably of up to 10 mg/kg) or a daily parenteral dose of up to 5 mg/kg body weight (and preferably of up to 1 mg/kg) is received, given in divided doses as necessary, the precise amount of compound (or salt) administered and the route and form of administration depending on size, age and sex of the person being treated and on 35 the particular disease or medical condition being treated according to principles well known in the medical arts.

In addition to their aforesaid use in therapeutic medicine in humans, the compounds of formula I are also useful in the veterinary treatment of similar conditions affecting commercially valuable warm-blooded animals, such as dogs, cats, horses and cattle. In general for such treatment, the compounds of the formula I will generally be administered in an analogous amount and manner to those described above for administration to 40 humans. The compounds of formula I are also of value as pharmacological tools in the development and standardisation of test systems for the evaluation of the effects of All in laboratory animals such as cats, dogs, rabbits, monkeys, rats and mice, as part of the continuing search for new and improved therapeutic agents.

The invention will now be illustrated by the following non-limiting Examples in which, unless otherwise stated:-

- 45 (i) concentrations and evaporations were carried out by rotary evaporation in vacuo;
- (ii) operations were carried out at room temperature, that is in the range 18-26°C;
- (iii) flash column chromatography was performed on Merck Kieselgel 60 (Art. no. 9385) obtained from E Merck, Darmstadt, Germany;
- (iv) yields, where given, are intended for the assistance of the reader only and are not necessarily the 50 maximum attainable by diligent process development;
- (v)  $^1H$  NMR spectra were normally determined at 200 MHz in  $CDCl_3$  using tetramethylsilane (TMS) as an internal standard, and are expressed as chemical shifts (delta values) in parts per million relative to TMS using conventional abbreviations for designation of major peaks: s, singlet; m, multiplet; t, triplet; br, broad; d, doublet;
- 55 (vi)  $^{13}C$  NMR spectra were normally determined at 100 MHz in  $CDCl_3$  or  $d_6$ -dimethylsulphoxide ( $d_6$ -DMSO) using the solvent signal as internal standard, and are expressed as chemical shifts (delta values) in parts per million relative to TMS; and
- (vii) all end-products had satisfactory microanalyses.
